

1. *What are the main components of a system? (e.g., hardware, software, data, people, processes)*
 2. *How do these components interact with each other? (e.g., data flow, control flow, information flow)*
 3. *What are the main goals of the system? (e.g., performance, reliability, security, cost, flexibility)*
 4. *How do these goals influence the design and implementation of the system? (e.g., trade-offs, constraints, requirements)*
 5. *What are the main challenges in designing and implementing the system? (e.g., complexity, uncertainty, change, risk)*
 6. *How do these challenges influence the design and implementation of the system? (e.g., strategies, techniques, tools)*
 7. *What are the main results of the design and implementation of the system? (e.g., performance, reliability, security, cost, flexibility)*
 8. *How do these results influence the design and implementation of the system? (e.g., feedback, iteration, improvement)*
